📁 PROJECT

HOSPITAL MANAGEMENT SYSYTEM

Hospital provides the most important service in the domain of healthcare. Technology can be used to make the healthcare service available to many people and also make the service more effective. People can access various services through web interface which enables the hospital management to provide the requested service.

A hospital website should provide information about healthcare. And also has to be responsive to the users queries. The website should give the basic understanding of the kind of services that the hospital provides to the patients.

In this way the technology can be used in the domain of healthcare. A web interface is just a smaller part of the whole technology that the modern healthcare socities use.

✏ DECLARATION
